QuickSort

Overview

Design and Analysis
of Algorithms I

QUICKSORT

- Definitely a “greatest hit” algorithm
- Prevalent in practice
- Beautiful analysis
- $O(n \log n)$ time “on average”, works in place
  - i.e., minimal extra memory needed

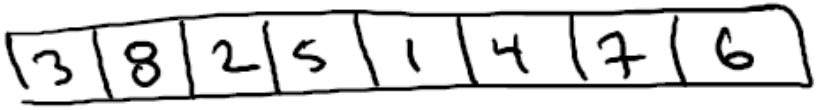
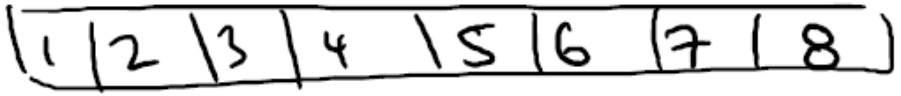
The Sorting Problem

Input : array of n numbers, unsorted



Output : Same numbers, sorted in increasing order



Assume : all array entries distinct.

Exercise : extend QuickSort to handle duplicate entries

Gopal

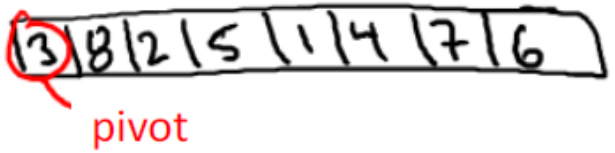
Partitioning Around a Pivot

Key Idea : partition array around a pivot element.

-Pick element of array



-Rearrange array so that

-Left of pivot => less than pivot

-Right of pivot => greater than pivot

Note : puts pivot in its “rightful position”.

Two Cool Facts About Partition

1. Linear O(n) time, no extra memory
   [see next video]

2. Reduces problem size

QuickSort: High-Level Description

[Hoare circa 1961]

QuickSort (array A, length n)
-If n=1 return
-p = ChoosePivot(A,n)
-Partition A around p
-Recursively sort 1st part
-Recursively sort 2nd part

[currently unimplemented]
