Digital Matte Painting

Techniques, Tutorials & Walk-Throughs

Collected and Compiled from a wide range of Online-Resources

Being in love with the art of Matte Painting, I collected these tutorials over one year from numerous online-resources and eventually compiled them into this document. Originally intended for personal use only, I thought that maybe some people out there might be interested too, so I decided to release them to the public. No big thing, and definitely nothing new – I just gathered these tutorials to have them all in one place. And if any – or all – of these tutorials happen to be new to you – even better!

A great thanks goes out to all the artists who put a lot of their time and energy into the creation of these tutorials.

Happy painting!

MBP aka Bass.T, 12/04

The Photoshop 7 Paint Engine

Part 1

Defining a custom brush tip shape
by David Nagel

Slap on your smocks and bust out your easels! We're getting down and dirty with some natural media effects in Photoshop 7's Paint Engine. Yes, this week we leave the timid realm of compositing for a while and kick off a new series exploring the sloppy side of digital art.

This new series was prompted, I suppose, by the overwhelming interest in the Nagel Series 1 Brushes I posted here on DMN a few weeks back. (My DMN subscribers can access the ad-free version of that story here.) Rather than answering every single "How'd you do that?" e-mail I've received on the subject, I thought I'd take the opportunity to walk you through the process and hopefully teach you some tricks with the Photoshop 7 Paint Engine along the way.

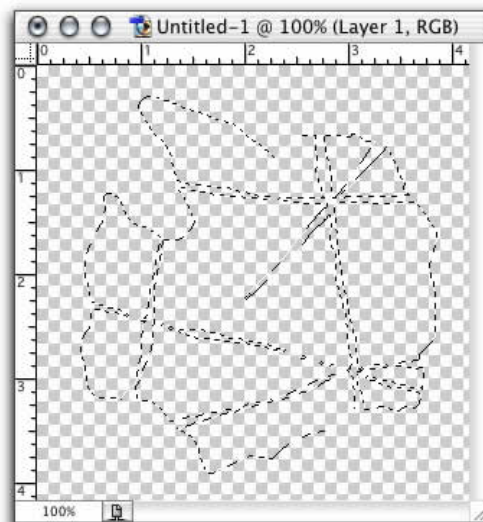

We begin today with a look at creating custom tip shapes for our paint brushes. Granted, the tip shapes are just minor details in the overall functionality of the Paint Engine. But they do constitute the first step along the way of creating your own brushes that can go way beyond those included in the default Photoshop 7 brush sets.

The basics

The creation of a custom tip shape can be as simple as placing a few dots on the canvas or as complex as generating recursive tips that build upon the foundation of a basic brush tip shape. For our example today, we'll look at the method used to create some of the "cloth" shapes used in the Nagel Series 1 Brushes. begin with a fairly large canvas--say 300 x 300 pixels--so that you can have some maneuvering room for the tip shape creation process. Then follow these steps.

1. First, define an irregular area on the canvas using the Lasso tool. After you've created the shape, hold down the Option key and use the Lasso tool to cut into the shape to create something of the effect of creases or gaps.

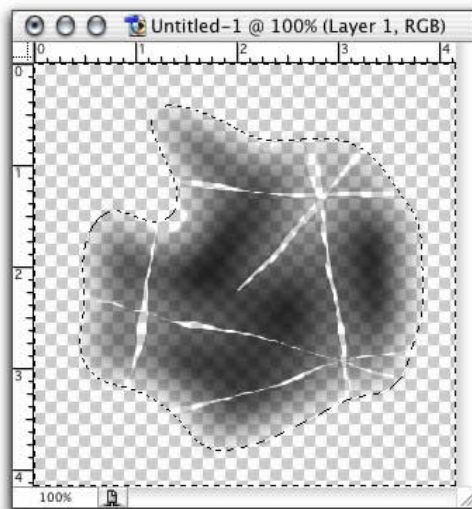

2. Fill the shape with black or dark gray using the Paint Bucket tool. You can use other colors, but keep in mind that when we actually get to the step of defining our shape as a brush, Photoshop will use luminosity information as part of the shape's definition. Grays and black are the easiest to work with for this purpose.

3. Choose Select > Feather, and feather the shape by about 15 pixels.

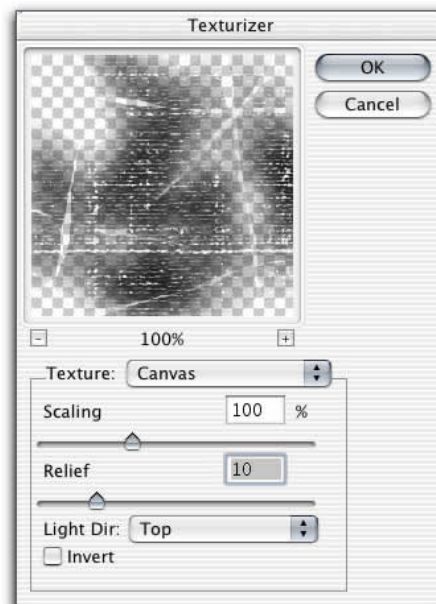

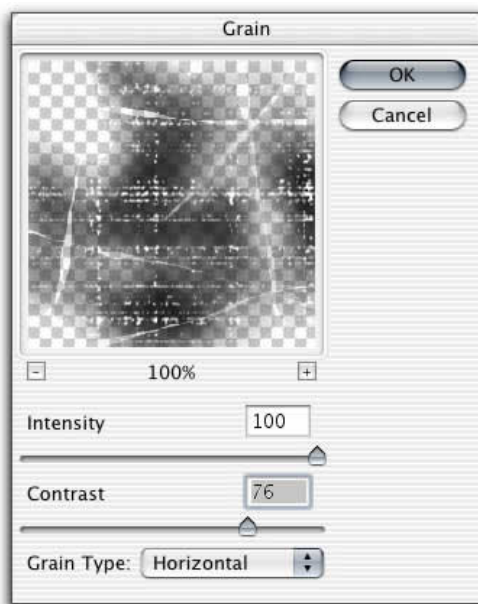

4. Choose Select > Inverse, and then hit your Delete or Backspace key two or three times. This will soften up the outer edges of our shape, which is essential for this process.

5. Do some touch-up work. Go in with your Eraser tool to soften up the inner edges a bit. A well defined shape is not going to work well for our purposes, so try to create some subtle gradations on the creases, while leaving others intact. You might also go in with a soft-edged brush and add some black back into the shape.

6. Run a few filters on the current image. I like the Grain filter (Filter > Texture > Grain). I'll run it once with the "Vertical" setting and once with the "Horizontal" setting. Then I'll apply the Texturizer filter to the image (Filter > Texture > Texturizer) using the Canvas texture. Apply whatever other filters you think might make for a decent cloth look.

7. Now choose Edit > Define Brush. When the dialog box pops up, name it "Phase 1," owing to the fact that we're not done yet. At this stage, you now have a fully functional cloth-like brush.

Getting recursive

Now we want to do more with this tip shape, so we'll do a little recursion. There are several ways to accomplish this, and I'm not going to get to all of them here. I want to save some of this for future installments in this series.

Now, what do I mean by "recursion?" I mean we want to use our "Phase 1" brush as the basis for building a more interesting tip shape. It's decent in and of itself, but we can certainly create variations with more detail and less of a pre-defined look.

To begin, save your current document in case you want to work on it more later. Then open up a new, blank document with transparency. You might want to make this one a little bigger than the first, say 500 x 500 pixels to give yourself more arbeitsraum.

The first method you can use is to paint on your canvas using the Phase 1 brush. Just draw a few overlapping strokes, trying to obliterate some of the repetitive details in the process.

When you're done, once again choose Edit > Define Brush, and call it "Phase 2." You'll have a whole new tip shape based on the first tip shape.

Another method--and one that I much prefer--is to play with Photoshop's dynamics before doing this. I'll give you three good methods for doing this.

Open up your Brushes palette, and choose "Shape Dynamics." Set "Size Jitter" down to 0%, but crank "Angle Jitter" up to 100%. Next, go to the Scattering settings in the Brushes palette, and turn on Scattering. Leave it around 90% to 100%. You don't want to go nuts with this, or your brushes will go off the canvas, and you'll be left with hard edges. Finally, go to Opacity Jitter in the Brushes palette. If you have a Wacom tablet, turn the jitter to 0%, but set the control to "Pen Pressure." This will allow you to control the opacity of your stroke with your pen. If you don't have a tablet, turn the control off, but set the jitter to some value between 50% and 100%.

Now position your cursor near the center of your canvas and draw a short stroke.

Notice how the texture in your tip shape is more random? This makes for a much better natural media look. You might then also go in with a white color on top of the black to bring out some of the detail that can be lost in the center of the stroke.

When you're done, select Edit > Define Brush, and call it "Phase 3." Using this new brush, you can now produce some pretty decent natural media effects.

Be sure to experiment with these techniques to create other shapes as well.

Part 2

Dual brush dynamics

Last time around in our exploration of the Photoshop Paint Engine, we looked at methods for creating custom brush tip shapes using paint tools and filters. Now we'll begin a new section covering paint brush dynamics, a set of features that help to make the Paint Engine in Photoshop 7 far superior to anything seen in Photoshop previously for creating custom brushes for emulating "natural" media (as if chemical-based paints were any more natural than digital paint tools).

Why?

Certainly, you can create custom brush tip shapes in Photoshop 6. But what happens when you apply them to a canvas? No matter what shape your tip, the strokes come out solid and flat except on the leading edges. There's no texture and certainly no sense of interacting with the canvas beyond drawing the shape of the stroke. So then to create nothing more than the "look" of texture, you turn to filters and become even further removed from the process, at which point you might as well give up on painting. It's all about the process.

But the dynamics in the Photoshop 7 Paint Engine allow you to move beyond this limit.

We'll begin with a brush tip shape designed to look like a small wedge of charcoal. If you'd not care to design your own to follow along with this tutorial, feel free to download mine here:

http://images.digitalmedianet.com/2002/10_oct/tutorials/pspainteng2021030/NagelCharcoalTip.abr

Now, if you look at the example below, you'll see that applying the brush in a single dab (the white dot in the middle) does indeed reveal some of the texture detail of the brush.

However, when you draw a stroke with it, the texture is lost, except along the leading edges.

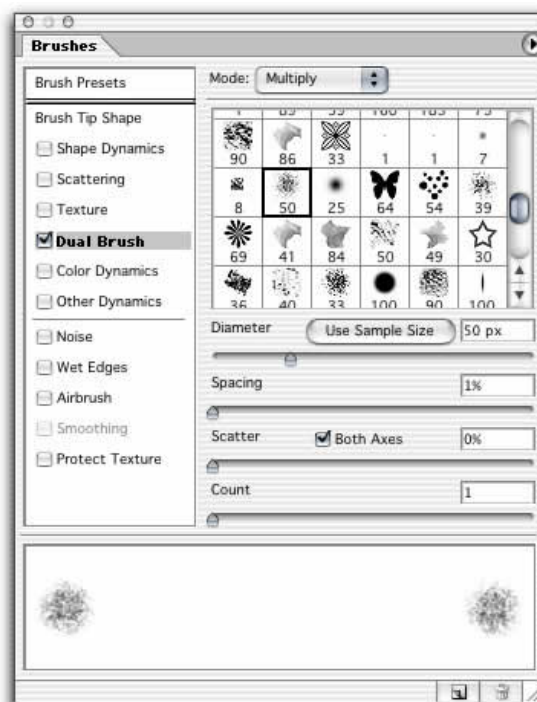

There are several things you can do about this problem using dynamics. But there's only one thing you can do that doesn't alter the texture, color or shape of your brush tip: the Dual Brush dynamic.

Dual Brush is an option that allows you to intersect a second brush tip shape with your primary brush tip shape. You can use either your current brush in the dual brush mode or any of the presets currently loaded on your system. For purposes of this tutorial, we'll simply be using the same brush tip as the primary and dual brush tips in order to preserve the appearance of the original.

To activate it, simply click on the Dual Brush name in the Brushes palette, and then choose the tip you want to use as the second brush.

Unfortunately, selecting a dual brush is not all that simple. The Dual Brush preview does not give you the option of viewing the brush tips with names,, so you'll have to be able to pick out the one you want from a pretty crowded selection. In my case, I know what the brush tip shape looks like and its diameter, so I'm able to locate it after a little effort.

The default settings (shown above) do not give us much in the way of revealing our brush texture. So we need to make some adjustments. First, change the spacing to something like 15 percent or so. This will reveal your texture more or less, depending on the velocity of your stroke. (The example below begins with a slow stroke and then speeds up.)

Next, adjust the Scatter up to 1000 percent (the maximum). Try the brush with and without the "Both Axes" option selected. Below you'll see the brush without (left) and with the "Both Axes" option.

You can also reduce or enlarge the diameter of the dual brush in order to reveal the texture of the brush in patterns. Here's I've reduced the dual brush diameter to 10 pixels, creating a dotted effect.

Finally, you can change the "Mode" of the dual brush to create variations. Each one changes the way in which the underlying dual brush reveals the primary brush. Below, from left to right, you'll see Multiply (default), Darken, Overlay, Color Dodge, Color Burn, Linear Burn and Hard Mix.

Note that scattering affects the ways in which the blending modes change your brush's appearance, as does the particular dual brush tip involved. But the most dramatic difference can be seen when adjusting the primary brush tip's spacing, which you can access in the "Brush Tip Shape" parameter. Below are the same examples as above, but with the primary brush tip's spacing set to 62 percent.

So, to recap, we've gone from this:

To this:

simply by adjusting the values in a single parameter in the Photoshop 7 Paint Engine. Not a bad start.

Part 3

Creating custom brushes with size, angle and roundness dynamics

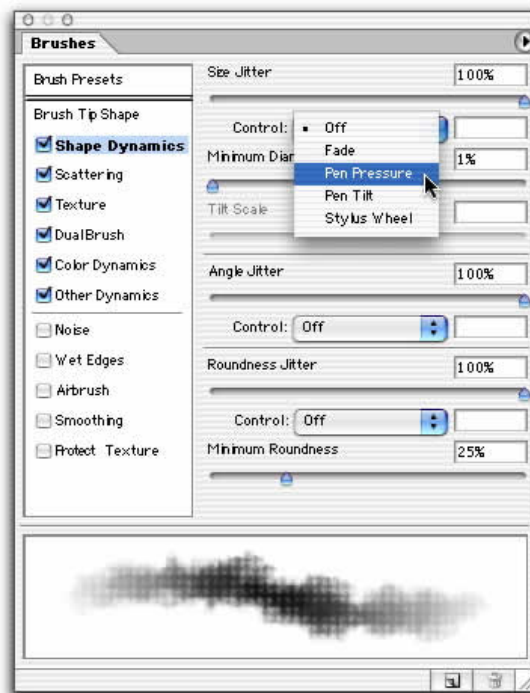

By now you know that Adobe Photoshop isn't just for image manipulation anymore. Far more than any other release of Photoshop to date, version 7.0 offers artists and designers functional tools for using the program as a painting application, for emulating "natural media" and for designing some pretty far-out brushes for creating original works of art. (Did I just use the phrase "far out?")

Over the last month or so, we've explored Photoshop 7's Paint Engine in some detail, covering some specific techniques for creating our own custom brushes. These have included techniques for designing brush tip shapes and also using two brushes at the same time, known in Photoshop parlance as "Dual Brush." (You can find both of our previous articles on the Photoshop Paint Engine in our Tutorials section on the left.)

The creation of custom brush tip shapes is obviously more a matter of individual talent than merely pushing a few buttons to achieve an effect. And, in a sense, so is the use of the Dual Brush dynamic, which will often involve the use of self-created brush tip shapes. But today we begin to look at uses of the more automated dynamics of the Paint Engine--size, angle and roundness--for creating your own custom brushes.

The Shape dynamic is probably the most important for those of us who use pressure-sensitive tablets. It allows for the interactive resizing of a brush tip and also provides other shape parameters that can be assigned random values, numerical values or interactive values based on input from your Wacom tablet.

After you've designed your new brush tip shape, open up the Brushes palette (above) and click on the Shape Dynamics button to check it. Here's you'll see three "jitter" dynamics: Size, Angle and Roundness. Each one of these also has sub-settings, which you can use to provide additional controls.

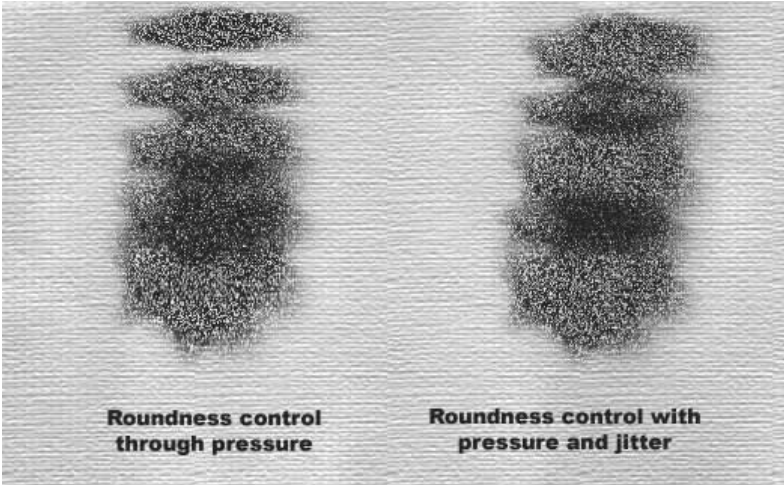

In most cases, you'll want to be able to control the size of the brush tip through your tablet. However, for some brushes, you might want the jitter to be random or even remain constant. For no jitter, set the percentage to zero. And for control over the size of the brush, set the control to one of the available options, most likely Pen Pressure or, if you have a Wacom Intuos tablet, Pen Tilt or Airbrush Wheel. (You can also use Fade, if you don't have a tablet, which simply evolves a given parameter over a fixed number of steps, as with earlier versions of Photoshop.)

But that's fairly obvious. What isn't as obvious is that you can also use jitter in combination with pen pressure or tilt to vary the size of the brush tip even as you're controlling it with an input device. This means that, as you use pressure (or tilt), the jitter of the size of the tip will tend toward the size of the stroke indicated by your input device. More pressure will provide a larger stroke with some jitter on the large side, while less pressure will do the inverse.

(Note that if you use tilt as the controlling parameter, you can also adjust the "Scale" of the tilt to increase or decrease Photoshop's tilt sensitivity.)

Now, to expand on shape dynamics, you can also add controls for angle and roundness. Roundness determines the obliqueness of the brush tip and can be controlled in the same ways as size. So, in other words, you can create random roundness, pressure-controlled roundness or a combination of the two.

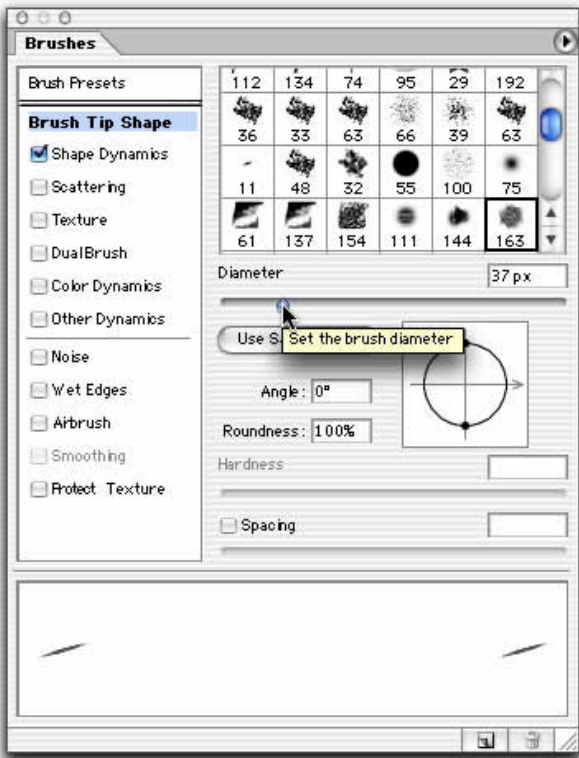

And then, probably the most useful of all parameters for emulating natural media, we also have angle jitter. Now, the angle of your brush tip will be more or less apparent depending on the shape of the tip, of course, but you can also combine the angle dynamic with roundness for a more natural-looking stroke and a stroke with better differentiation in directionality.

Fortunately, with the angle dynamic, Photoshop 7 gives you two additional control parameters: Direction and Initial Direction. As their names imply, they allow you to control the angle of the brush by the direction of the stroke, which is certainly more natural than other methods and also frees up your input device for controlling other parameters.

Using Initial Direction, Photoshop attempts to determine the angle of your stroke based on your initial input. This can be hit or miss, particularly with a graphics tablet, as your initial touch on the tablet might be slightly off your desired angle. But it is useful in particular for calligraphic brushes. And the plain old Direction parameter is useful for other types of brush effects where you need Photoshop to track the direction of your stroke interactively.

As you saw from the example above, the effect can look somewhat striated, but this is owing to the spacing in the particular brush stroke I'm using, as well as the size of the brush tip. Both can be modified in the Brush Tip Shape pane.

Roundness settings can also affect the look of an angle-controlled stroke. Below you'll see examples with size, spacing and roundness altered.

All of the dynamics above are for tightly controlling the appearing of your brush tips and overall strokes. But there are numerous occasions where tight control is undesirable and accident plays a more important role in the look you're trying to achieve.

Part 4

Working with color dynamics to preserve texture and add depth

It's difficult to say which aspect of Photoshop's Paint Engine is the most important. Custom brush tip shapes, textures, shape dynamics: They're all important for creating custom brushes, especially for natural media emulation. But what do all of these matter if you lose the texture and shape of your brush when you're painting?

Enter Color dynamics.

Let me give you an example of what I'm talking about. Let's say you go to the trouble of creating a brush tip that's designed to resemble cloth. You get it looking just right, apply some shape and dual-brush dynamics to it, and then start painting. But what happens?

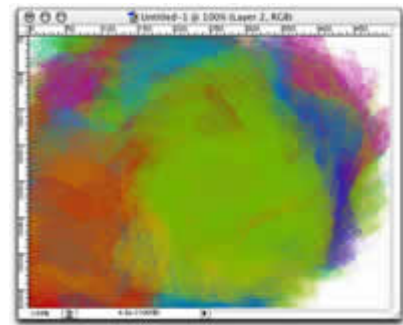

You go from this starting brush:

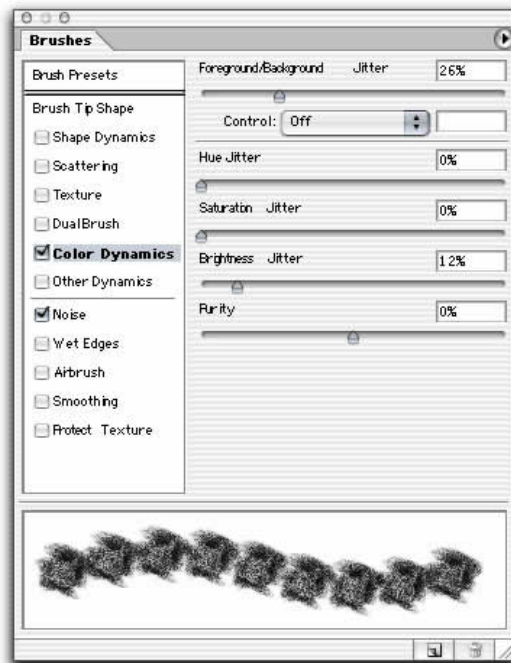

To this flat painting:

But using Color dynamics with your brush, you can avoid this mess and preserve all or some of your original brush tip shape.

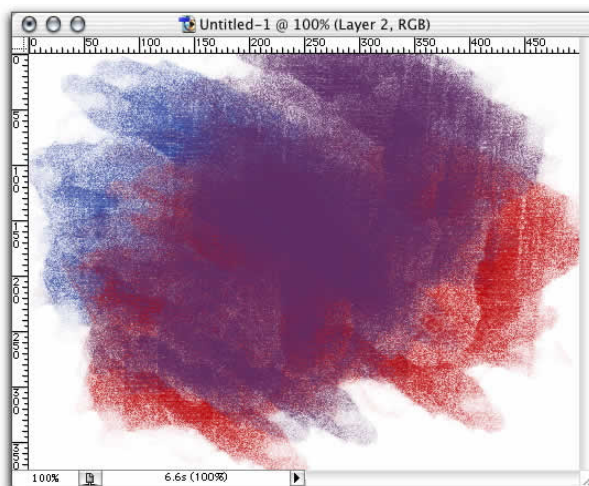

Start by opening up a brush that you've created using any of our previous tutorials, which you can access by clicking the Tutorials button on the left. Then open up the Brushes palette, and click on the Color Dynamics option.

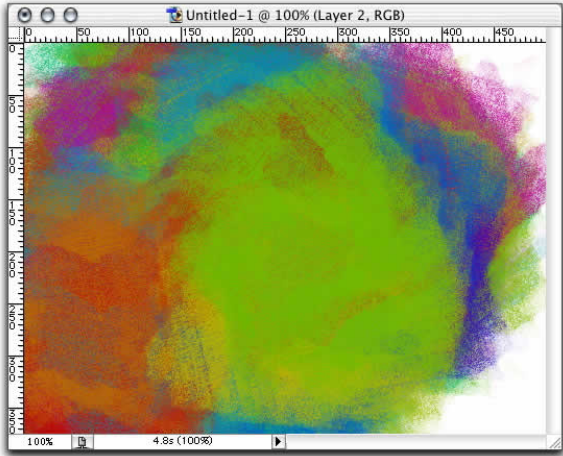

Here you'll find a number of settings for modifying the color of your strokes, each one valuable for different purposes. Each of the "Jitter" settings allows you to modify the color of your stroke. With the Foreground/Background setting, you can set your strokes to fade between foreground and background colors, and you can also set the amount of fade to be based upon input from your drawing device (such as a pressure-sensitive tablet) through pressure, tilt or airbrush wheel. You can also set it to fade over a set number of steps.

Setting the jitter to zero will cause Photoshop to blend between the foreground and background only through your specified control. Increasing the jitter will through randomness into the blending in addition to any controls you've set. Or, if you set the controls to "off," you can have a purely random jitter. In the example below, you see the foreground (red) blending with the background (blue) resulting in purple with a medium amount of pen pressure.

The other jitter settings in the Color Dynamics parameters don't allow for any control whatsoever. They're totally random, with jitter based exclusively on the percentage of jitter you apply. Below you see two examples of Hue Jitter, the first set to 100 percent, the second at 15 percent. Both allow you to maintain the original texture of your brush but offer some widely varying results. (Both use red--186,2,2--as the starting color.)

The Saturation Jitter, on the other hand, produces much more painterly results, fading the color from full saturation to no saturation, as in the example below with a setting of 100 percent.

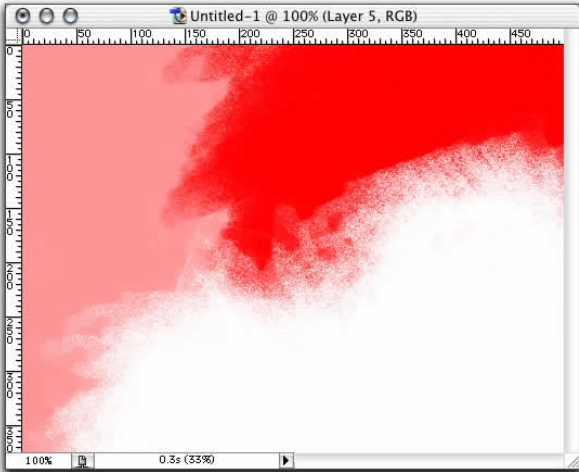

And finally, the Brightness Jitter setting allows you to alternate between fully saturated shades of your primary color. The examples below show the jitter at 100 percent and 15 percent, respectively.

All of these jitters can be used in conjunction with one another not only to preserve the look and texture of your custom brush, but also to create a feeling of depth with very few strokes. The following example is a single short stroke over a white background using a red color. The settings are: Hue Jitter, 6; Saturation Jitter, 67; Brightness Jitter, 17.

There's one last setting in the Color Dynamics palette called "Purity." This is a setting for moving away from or toward even RGB values. The default zero purity leaves your colors as they are. Increasing the value leaves the dominant color alone and decreases the secondary and tertiary values. For example, a color consisting of 255,150,150 will fall off to 255,0,0 at a purity setting of 100 percent, while a setting of -100 percent will give you a color of 255,255,255. The example below show the original, the 100 percent and the -100 percent Purity values.

Purity can also affect the individual jitter settings by forcing them to conform to a certain range of values.

Part 5

Delving into directionality to create 'Spirographic' brushes

This is our fifth exploration into the Paint Engine in Adobe Photoshop 7. Since so many of the remaining parameters in this program are self-explanatory, I thought we'd break away for a while from simple feature explanations to a more practical look at what you can do with some of the Paint Engine's dynamics--in this case directionality for creating geometric and "Spirographic" line effects.

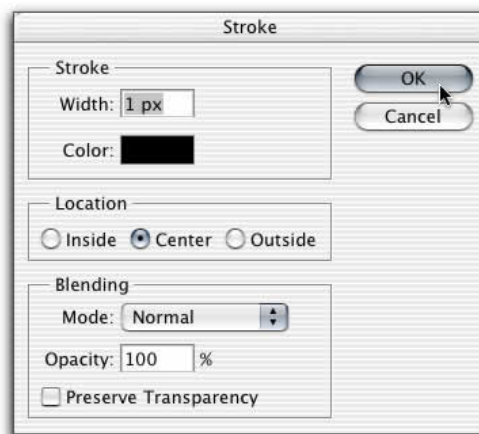

The goal of this particular tutorial is to work with various directionality settings in Photoshop 7 to create two sorts of effects: intertwining lines and "Spirographic" patterns, similar to what you could produce with a Hasbro Spirograph game. That is, effects that produce repeating, overlapping lines like meshes. This needn't be applied simply to lines, however. You can use this same trick on ore complex brushes for producing repeating, but shifting patterns out of any brush tip shape, including images. In the end, we'll wind up with a paint brush that can accomplish this effect interactively by simple freehand drawing or through path stroking.

Creating line-effect brushes

Since the goal of this tutorial is to produce brushes that create line effects, we'll begin with the creation of a single-pixel-wide brush. But, again, you can use any brush tip shape for this process. (Later in this tutorial we'll look at more "Spirographic" brushes as well.)

Open Photoshop, and create a new document. Switch to the Single-Column Marquee Tool, and click somewhere in your canvas. Then choose Edit > Stroke. In the dialog that pops up, enter a one-pixel stroke width using black as the stroke color.

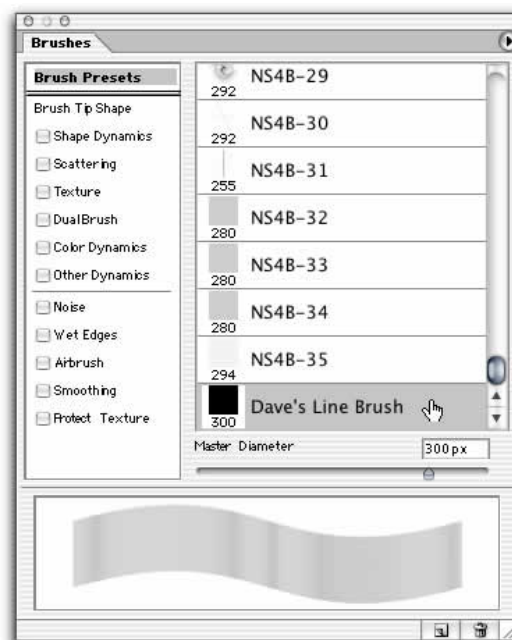

Deselect your column (Command-D Macintosh, Control-D Windows), and you should be left with a simple vertical line.

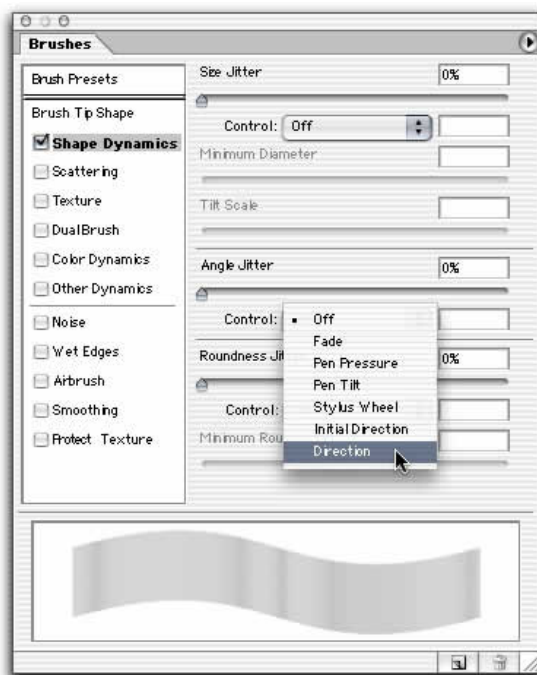

Now switch to the Paint Brush Tool and then choose Edit > Define Brush. This will use all of the visible pixels in your image to create a brush tip shape.

Now open up your Brushes palette. The currently selected brush should be the one you just defined. If you try to use it at this stage, you'll get sort of a scrolling effect. But we want to take this a step farther.

So click on the dynamic in the Brushes palette called "Shape Dynamics." Turn everything off, and then switch the Angle setting to "Direction." (Leave the Jitter at 0.)

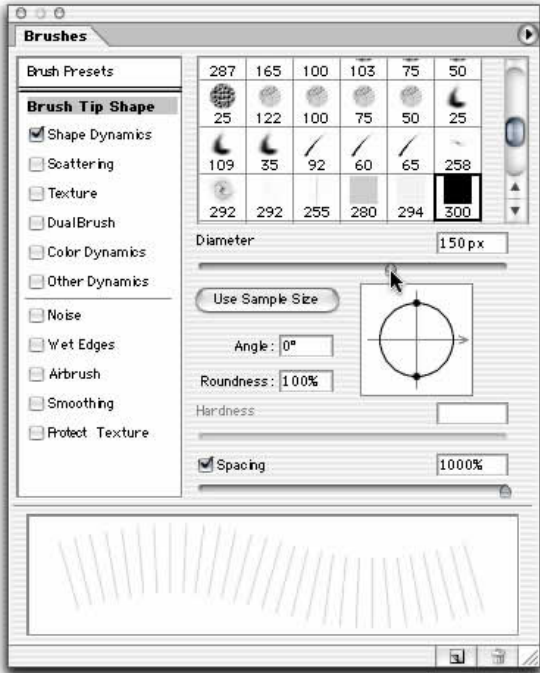

Now you can draw with it at this point, but the result isn't too pretty.

So, in the Brushes palette, click on the Brush Tip Shape option. Here you can do two things to improve the look of your brush. First, you can set the spacing to 1,000 percent, which will give your strokes a much more delicate appearance.

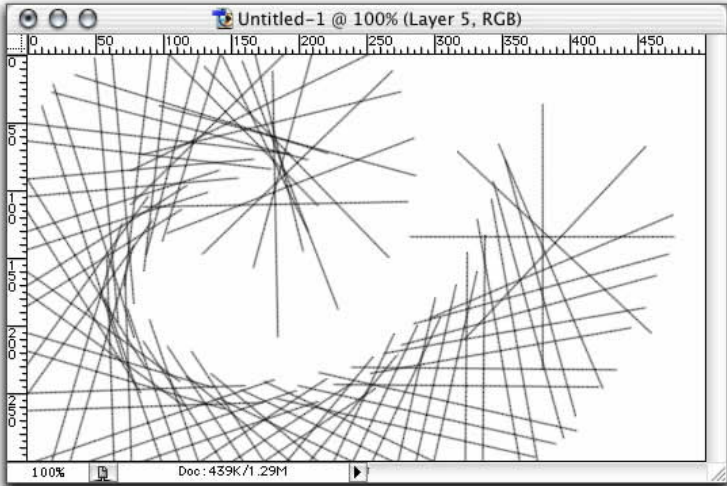

And you can also switch the Diameter down to about half of what you started with to produce lines that use a stroke less than one pixel wide.

And, finally, if you want to cover a wide area with your line-effect brush, you can select the Scattering dynamic. Set it to "Both Axes," and adjust the amount of scatter to about 400 percent. Set the "Count" to 8 or so. Now when you draw on your canvas with a couple of curly strokes, you quickly wind up with an image full of web-like, intersecting lines.

Very nice. But maybe a bit less mesh-like than what you had hoped for. This is owing to the fact that we used a single-line brush tip shape in our initial brush tip shape creation phase. But we can apply limitless variations to this. For example, instead of a simple line, we could create an X-shaped brush tip to produce this effect with a single stroke. (Of course, you'd want Scattering turned off for this.)

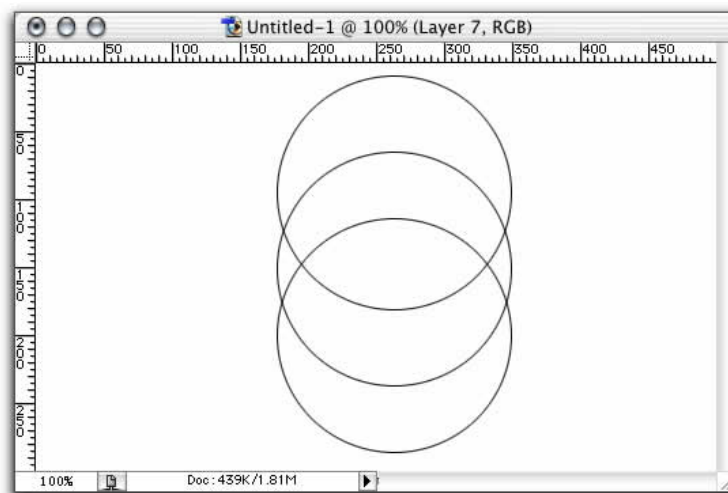

Or a double-X for this effect.

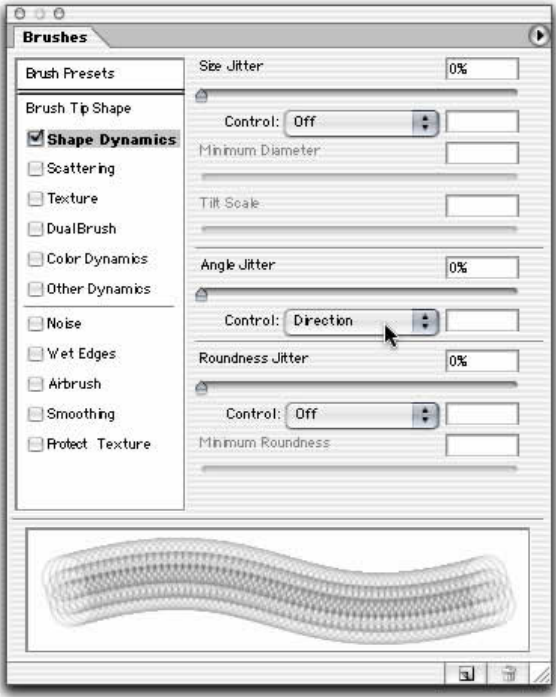

Getting 'Spirographic'

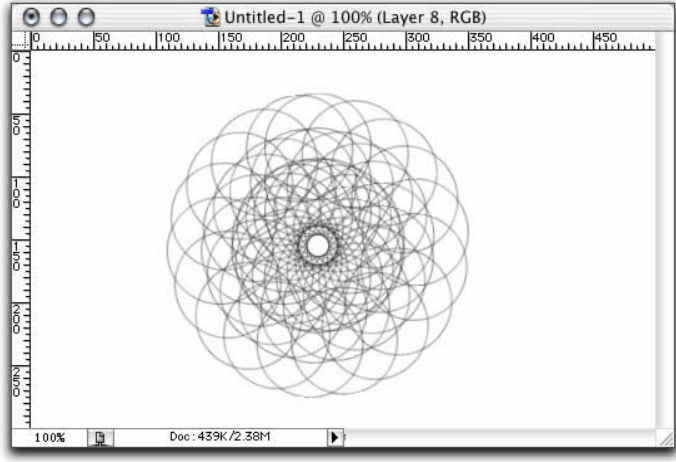

Get the idea? The more complex the initial brush tip shape, the more complex the geometric effects you can create quickly. But for even more of a Spirographic effect, create your brush tip shape using circles. You can do this several ways. The easiest is simply to draw a circle with the circular Marquee tool, and then stroke it, as we did with our original line brush. Then duplicate this layer to create double or triple intersecting circles.

Now, making sure that only the layers containing your circles are visible, choose Edit > Define Brush. And, again, apply your Brush Tip Shape options to make the circles more delicate, and apply your directionality setting in the Shape Dynamics parameter. You may or may not want to adjust spacing, but that's up to you.

And you will hopefully wind up with a brush that can create an effect like this.

Or this.

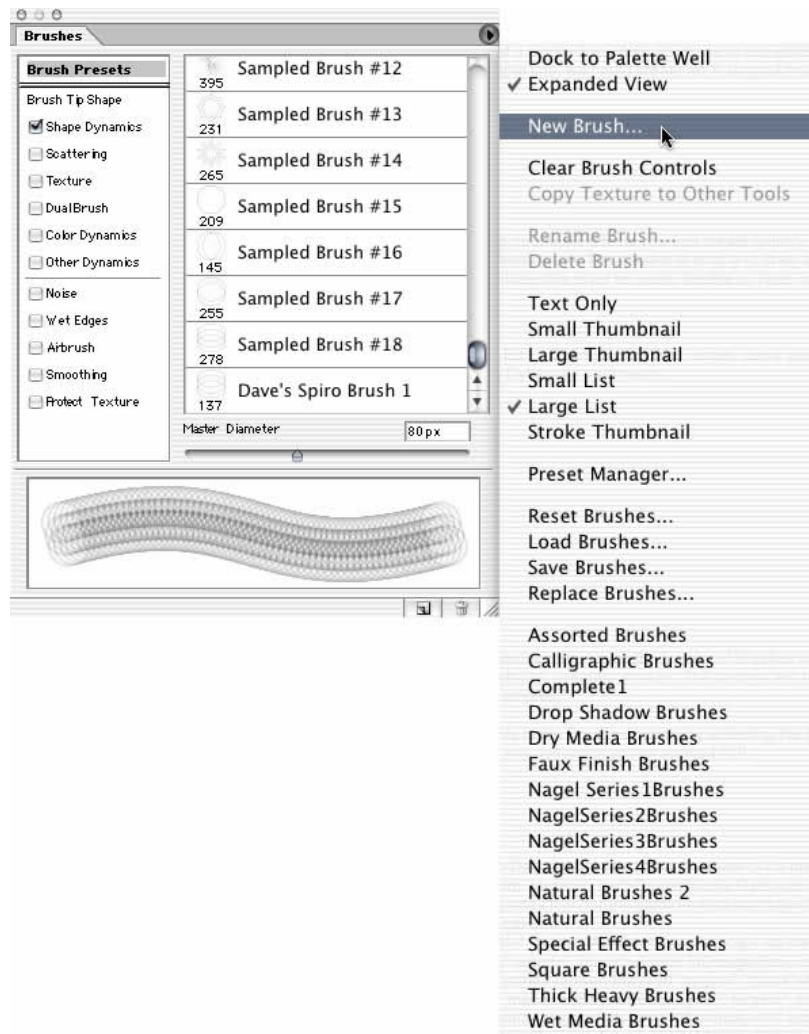

Pretty fancy, eh?

Working with geometric brushes

Of course, there are multiple ways you can work these sorts of brushes into your production. I think the first set of brushes we worked on are geared well for freehand drawing. That is, you can scatter them freely to produce complex, web-like, irregular strokes. The second set, however, seems better geared toward stroking paths, which is what I've obviously done with the previous two examples.

This is a fairly simple procedure. Save the brush you have created. You can do this in the Brushes palette by selecting the flyaway menu on the top right and choosing "New Brush." This will save not only your brush tip shape, but also any dynamics you've applied to it.

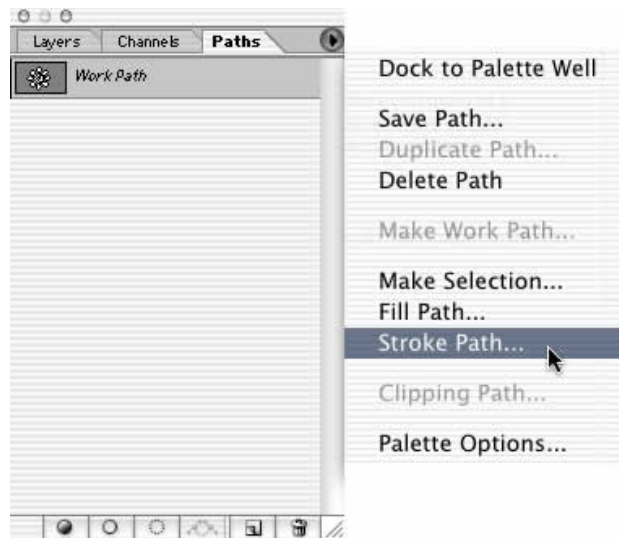

Make sure that you then select your newly saved brush in the Brushes palette.

Now create the shape you want to stroke. You can do this semi-freehand using one of the path tools, or you can load up a shape using one of the Shape tools. If you do use one of the shape tools, make sure the "Paths" option is selected up in the Tool Options palette, as shown below.

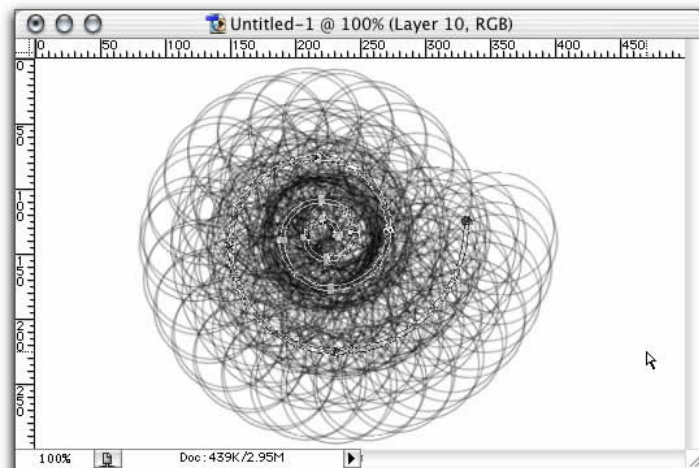

Now draw your shape onto your canvas. When you're done, open up the Paths palette, and make sure your path is selected. Then choose the "Stroke Path" option from the flyaway menu.

When the dialog pops up, choose "Brush" as your stroke, and then hit OK.

Your path will then be stroked using your custom Spirographic brush, and you can go off and impress your friends and colleagues with the geometric complexity of your work.

Painting clouds

I used Photoshop, but any paint program should work.

(Left, cropped from a larger image.) I start with a ramp like the one on the right; be careful not to use full saturation here. Up to your preference, if you want to make the background a little more purple.

Start painting with max saturation and max value a 'peachy' color on a large default brush (sharp edge, pressure-sensitive opacity). Quickly block in the rough shapes where light would fall on your cloud. Take special care here (and any time you're painting something in nature) to not be too predictable, symmetrical or regular.

Go down in brush size and do some more detailed strokes.

The shadow color is added, a purple so dull it's almost gray. Then add the darker orange/red color wherever the peach meets the shadow. Also, normally, clouds will be brighter at the top so add it at the base too.

Now the highlight color, a slightly lighter peach. Use the finest brush and squiggle it on wherever there's a left-hand facing edge of the cloud. Again, don't be predictable and regular.

We need to soften the right-hand side edges of all these squiggles, while trying to keep the left sides as sharp as possible. You can use a small blur brush, or a smear, or simply paint back the base color into the highlight.

Go back and forth, adding more highlight squiggles, softening some parts, bringing the shadow color in with a finer brush too in some places, etc.

On the right is the finished cloud.

Here's a cloud similar to one I saw today, around noon, near the horizon, through my office window. The light is coming not from the side or above, but about 45 degrees or so. This changes where you need to put the highest values; instead of at the edge of each blob of cloud the highest value ends up pretty much centered. So a different technique will be more efficient.

Use a similar ramp to the above, just a bit lighter.

Create a new layer and paint with a sharp edged brush a value slightly lighter and less saturated than the lightest sky color. Darken it a bit at the bottom.

Turn on 'Preserve Transparency' for the layer and paint full white with the airbrush like this. Vary the brush size quite a lot. The goal is to get this kind of 'cauliflower' look.

Then add another layer and paint with a fully opaque sharp edged brush the original cloud color, like on the right.

Same thing again, switch on 'Preserve Transparency' and paint white with the airbrush.

Repeat this cycle until the whole cloud area is filled up. Remember to try to get the edges of each layer a little closer in the beginning, and more widely spaced towards the end (due to the perspective).

On the right is the finished cloud, note that you can tweak it very easily by using 'Curves' on each layer. I darkened the first layers, also changed the coloring a little. Other tweaks included some added detail on the bottom layer, and airbrushing more white here and there.

Of course instead of the airbrush you could try this with all sharp edged brushes, for a more painterly expressive style.

Creating a Spiritual City
Jaime Jasso

Award-winning CG artist Jaime Jasso takes us through the creation of a superbly-integrated 2D environment made almost entirely from photographic elements, hand-tweaked and painstakingly retouched in Photoshop to fit the scene.

My idea behind this painting was to create a place where the viewer would feel spiritual peace, but at the same time have a sense that the place is dangerous. I made this image by joining more than 70 photos together with some 100% painted elements too. All the elements were heavily edited from the original to be integrated into the composition because I needed them for a specific purpose.

Admittedly, some of the perspectives in the image appear out-of-whack to our critical eyes, but the focus of this article is to demonstrate how I worked the composition up to this point, despite the corrections that could be made to make the composition more physically accurate.

Concept Sketches

The idea was born when a friend of mine returned from Argentina and gave me this cool postcard of Iguazu Falls. Inspired by this I started sketching out this land of waterfalls and moody jungle. In the first sketch, I considered including a huge gothic castle connected by bridges to smaller structures. Then I designed the look and composition of the image, playing with the architecture between the waterfalls.

Later, I realized that the scale of the castle was too big for the falls, because I wanted the landscape to look huge and menacing as well. So I decided to change the design of the castle for a cluster of smaller temples linked together to build a 'spiritual city'. In my following sketches I played with mood and color. I decided to use an overcast and mysterious complexion for the composition instead of a night shot; otherwise I would lose a lot of the detail in the waterfalls, foliage and temples.

Composition

The first step was to set my working resolution. I chose to work at about 3500 pixels wide, mainly because I was working with images from the Internet.

Reference Gathering

Atmospheric Effects

I looked for real photos to use as reference to see how a gloomy and hazy outdoor atmosphere affects the saturation and shape of elements as they become more distant. After studying these photos, I noticed that causes faraway shapes to lose contrast and gain in brightness. When it came to working on the image though, I didn't attempt to completely render the faraway elements with this realistic haziness because I wanted the shot clearly defining some of the distant details. Overall though, I did try to mimic this weather as accurately as in reality except for one little cheat in the final image to retain some of the detail.

Architecture

I did a lot of research into the sorts of architecture I was going to work with. Looking to some mosques in Jerusalem and Turkey I found great references for buildings to make perfectly the architecture I had in mind. I started a longer search for high resolution photos of mosques and similar architecture. It took me quite a few days to get all the photos I was going to need.

Waterfalls

In this phase, I also gathered a lot of high-resolution waterfalls photos that I knew I'd need. I found some great material of the Niagara Falls, and of course Iguazu Falls, that would help me achieve the desired perspective and feel.

Finally I managed to gather together a collection of over 150 high resolution images from different websites. Now, how would I use these photos in my image? Where does each belong? And where can each image blend best with respect to the others?

Compositing – Natural Environment

I began to create the waterfalls using almost 20 different photos. I did a lot of cloning to get the water and falls blend seamlessly. To get the effect of distance in the water, I had to scale down some layers and paint the far distance water by cloning more water.

Once I had the falls done, I began to work on some of the details such as the little foliage islands in the water. These I manufactured by cloning a small jungle and foliage area in a photo. Later, most of the foliage was retouched and detailed with extra touches like branches, shadows and special reactions in the area where the foliage touched the water. Done with this, I had to add the turbulent water buffeting these little foliage islands to show the water is really being affected by these pieces of land on its way to the falls, completing the integration of the foliage and water.

Later I created the sky by mixing two layers I found on the net. I desaturated both a little bit and added some lightness to it, making it clearer and less contrasting. The background mountains were hand-painted. Taking care to reflect the haze and lightness values of distance, I did the mountain shapes with a solid color that later was replaced by the correctly-colored gradient. (see image above)

The rear waterfalls were added later, after the city and temples, along some of the steam. It was painted in by hand to give the effect of a huge amount of water falling and crashing down in to a river that we don't see. (see image below)

Compositing – City and Temples

I then worked with some of the architecture photos, and started patching together some composites over the landscape. The foreground tower was something I didn't have in the original sketches, but the idea came out when I was looking for appropriate images on the Internet and found a special photo that gave me the idea. I modified the shape and color, and removed the direct sunshine with its hard shadows from the original photo, so it would fit in the composite.

The temple at the end of the bridge was entirely hand-painted because I never found a photo with the correct perspective. I took values from other photos I had composited there to paint it more accurately.

For the middle-ground city I had to be very careful about what architecture and micro composition I was going to use. I selected the photos and began to do experiments to trial structural arrangements in that area of the image.

There was clear evidence in the image of the peculiarities of the original photos I used to build this middle-ground part of the city. I had to make these buildings blend in with the overall weather. I desaturated the colors to push back some of the temples. I then altered the brightness/contrast and hue/saturation to make them hazier, as they are further away from the viewer. I also reduced the contrast where the sun was hiding behind the clouds and added a lens flare to help me get the buildings integrating into the haze of the overall atmosphere.

I joined together more and more photos to create the background part of the city. I applied the same techniques to lighten and lower the contrast of these layers. However, I still had to take some steps to better match these images with their environment. First I painted the highlights, which was very important because the sun light was coming from the left. Then, in a fresh layer, I painted rough highlights with colors taken from other layers used for the middle-ground. Later, I set this layer to the blending mode 'Color'. So the highlights layer and base building layers were now filtered through this color layer that was set to be only partially opaque. Thus, the colors in the whole image were desaturated as part of the effect of distance.

Compositing – Foreground Additions and Haze

To give it a more natural and 'alive' look, I added three flying birds that I took from a photo, with a small amount of directional blur to convey the effect of motion.

In the original sketches I had a foreground tree, but with the new foreground tower I thought it less necessary. I still thought I'd put some branches in to frame the image, but not the whole tree. These branches were hand-painted, and while it may not be strictly correct, I used a black to brown gradient going down to the thinner branches. I just wanted to give some translucency to the slender twigs. (see image below)

As the final touch, to give it a generally hazy mood, I added a new layer at the top of my composite that simply had a white to transparent gradient over it, making the sky and upper elements blend together in the homogenous weather and atmosphere.

Post-processing

In the post-processing I made a little color correction, with green being the main color of my palette. I also added a bit of film grain to give that special photographic touch.

Final Image

The hand painting and editing used no custom brushes, and the rest just involved changing opacity, colors, modes, and resizing. The image was done completely in Photoshop.

Final image

Final image + top haze layer

Here's another of Jaime's works:

Digital Matte Painting Using Photoshop

In the past 4-5 years visual effects stopped being something extraordinary and became a part of almost any production regardless of the scale. Would it be a 100 million dollar Hollywood feature, TV series or an independent film project, ability to enhance visuals with computer generated imagery (CGI) have become accessible to almost everyone. In today's world of money and profit, producer thinks of a cheaper way to achieve something that used to cost millions. Visual effects come in place when the world we live in cannot provide us with imagery we need or the cost of recreating certain phenomena would jump over budgeted.

One of the most important parts in visual effects, and also one of the easiest and cheaper one to do is a matte painting. Regardless of whether it is painted on a piece of glass or generated on computer it serves one purpose – creating or extending the virtual space of the scene. As every art, this one has its secrets and cheats. Unlike traditional art, where "cheating" is considered to be a bad manner, matte painting requires final product to be done in the most efficient way possible. Don't be afraid to make shortcuts if they are possible, because time always works against you.

In this tutorial I will cover a process of enhancing footage to fulfill the needs of story. It all begins with the script that calls for some change in original footage. After agreeing that the best way to specific shot is to enhance it digitally, I start to create a concept of how to incorporate these enhancements in original footage. There are many small details that have to be overlooked for the purpose of a smooth compositing. First I have to think of a camera movements and composition. In my case, the idea to create a matte painting came before we started filming, so I didn't face any problems related with an unexpected change of plans during production.

The story called for a remote location covered with snow for all outside scenes. As the film has mainly interior shots, we decided not to go to Colorado, but shoot background plates here in California and just paint the snow in. The example I use here is a test that was done to prove that it would be financially better to make a painting. We shot a background plate using still camera then replicated lighting conditions on a green screen stage in Ventura, California for our foreground plates, which had actors and a car in it. We decided not to have any camera movements to speed up production, because outside shots weren't important on the bigger scale and had to be simple.

I started with a picture I took in Santa Barbara, a very nice and worm city, were snow is something that people don't see very often.

First I had to clean the picture by eliminating all of the unnecessary objects and paint parts of the plate that were obscured by the removed parts of the picture. This process requires a vision of the final product. Without understanding what the final image is going to be it is very hard to make decisions on what has to be left. The main rule I learned while doing matte paintings is that if you can leave specific parts of the picture intact or use a photo to replace it – then do so. Nothing will look as realistic as a real life source. For the final touch up, I darkened the color of the road to add wetness to it.

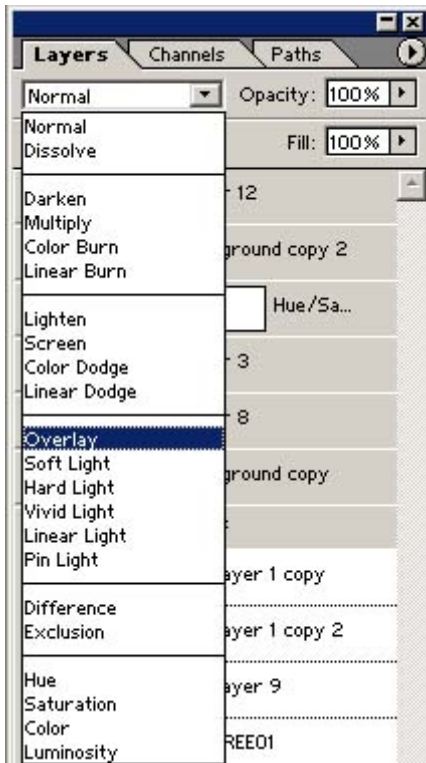

As an empty background color I always use the dominant color for specific painting. In this case it is the color of the snow – white. The purpose of this is to being able to visualize your final product in the early stages. In this case it is also the color of the sky, so I add a little gradient by darkening the horizon line.

Speaking of a horizon line, it is good to make one early on, so you won't have and unexpected perspective artifacts. This is done finding existing perspective lines (blue) and drawing the line through the point of their intersection (red) which will be our horizon. After we have established all necessary elements it is time to start painting. The next step would be to create a ground plane. I painted some free strokes using mainly three shades of snow from light to dark gray. The idea behind the matte painting is the same as behind impressionistic painting. You just create an impression, but on close-ups the reality breaks on strokes and colors.

As in real world, there can't be any flat colors. Of course there are exceptions, but the nature is full of texture that mixes colors in a very organic way. I said before that if you can use photos the use them. I applied a black and white photo of a grass field on top of the ground plane to create imperfection in color. To do so, I placed a layer of grass on top of ground layer in photoshop and overlaid top layer over the bottom one.

This creates a more dynamic range of shades as well as adds a texture to the ground plane.

Next step is actually painting snow on our plane. Before doing any matte painting it is always good to do research on a subject of your painting. In this case it is snow. Snow might seem a very easy subject, but in fact it has a very interesting nature. Under different weather conditions, snow has different color, shape and interaction with environment. In my case it hasn't snowed for couple days, as well as it is not windy, so the snow is not blown off the house.

If you look closer you can see the simplicity of technique I used. I projected the snow on every surface as if it was falling down directly from the sky. I added little imperfections, but the underlying idea is very simple.

With a little help of imaginations you can predict which areas would be exposed to the snow in case if the snow was falling in the straight vertical direction. The ground in front of the house has a little different technique than the snow on the roof. Again, the method I use for specific areas of this painting is used on research I do. I can't stress enough how important to the your "homework". In the case of the snow in front of the house, I chose areas that would be physically blended with the underlying ground plane. I assumed that outside temperature is very close to 0 Celsius. Hence, the areas where the snow is not thick are more "wet" and thus blended with the ground.

I used this blending technique on the areas where snow meets ground areas and sometimes on the snow itself to create uneven texture. Besides snow I added small vegetation, like frozen grass and small bushes. This added more realism to the flat areas of snow. Another reason for this was to create an atmosphere for this painting. I think that trees and the way they branch can greatly affect the mood of the scene.

On this picture you can see a relatively simple tree behind the house. This is the first step in changing direction for this painting. As with snow, I used plain color, after I finished the tree structure, I moved to adding snow with the same technique I used for the house roof. Since we have a foggy atmosphere, this tree has to be a little lighter. If I had a plain background with no intention of having something behind this tree I would change the opacity. Rather than doing it I went to Image->Adjustments->Levels to reduce output black level.

If the background was something other than gray color, I also had to tweak its color palette.

Next I would fill out the background plane. I usually create 2-3 trees that I'd scale flip to randomize it a bit. Depending on the type of a matte painting you have to put different amount of dedication. If the painting will be slightly out of focus, or the camera will have some movement, I don't spend much time on background objects, or on something that doesn't have viewer's attention. As with the previous tree I changed output black level to match the fog depth.

Then I paint the rest of the forest, recycling the trees I used before plus using some photos. I painted some snow on the fir trees and then put several of those on the background. Final touch is to make some foreground trees. It's good if you can get some photos. I finished them by painting snow and adjusting levels. For these fir trees I didn't worry much that they looked duplicated, as I painted snow on individual trees differently.

Now, when the painting is done, you can change it to whatever the shot requires you to use it with.

By using simple color correction techniques, I was being able to change the time of day or the mood of this particular painting.

Here is what I ended up using for production purposes.

Matte Painting in Photoshop

Part 1: Maison

This tutorial is actually a "making of" where I explain how I proceeded to achieve this matte painting. I use a Wacom Intuos² A4 board, if you don't have any graphic board this is going to be hard but not impossible. At each step of the matte painting, useless to remind you to create a new layer so that the work will be easier and mistakes avoided !

First of all, find a good res picture. I chose to use a picture of a house I found on the web. You can find very nice pics for free, just look around !

The first step is to isolate the house by putting it on a separate layer and by erasing the rest. In this example I used the polygonal lasso tool for the house, and a soft eraser for the bushes.

Now you need a new background. You can either find a good pic, either paint one yourself.

I chose the former because it is less time consuming, and the result is far better than what I would have gotten had I painted a background myself. I found this image on the web, unfortunately I do not remember the site I got it from.

Put the sky behind the house (by putting the sky layer under the house layer), and apply a little perspective effect to give more depth to the sky, make it less flat.

Here the house picture was taken from a low angle, which makes our work easier.

Now look at the edges of the house. They still are the color of the original sky. We'll fix that.

Using the magic wand tool, select the empty zone of the house layer. Then, Select > Modify > Expand, to make your selection wider. Pick a value that includes the zone we need to color correct. In the menu : Image > Adjust > Hue / Saturation and color correct the edges by matching them with the color of the roof.

Still using Hue / Saturation and also Color Balance, adjust the colors of the house and sky layers so that they perfectly blend together.

Now we want to get rid of that palm tree that hides a part of the house. That tree has nothing to do there since we want to create a morbid mood.

This is probably the most delicate step because we have to hand paint the missing part of the house. For that I mostly used the clone stamp tool, tool that allows you to paint something using another part of the picture for reference. For instance, the tiles located between the lower and middle windows were painted using similar tiles of the house, using the clone stamp tool.

Why not add a lightning bolt to make the scene a little more disturbing ? Using the simple non feathered brush, this is simple. Draw your lightning, duplicate the layer, and blur the copies to make the lightning glow. Then, use the Dodge tool to brighten the clouds from where the lightning is originating.

Paint dead trees behind the house, or use existing ones from pictures. Of course, make the colors and luminosity match.

The fun part, now ! Let's break down the house. Well, not all of it. To make it look older, I added a hole in the roof, painted with brushes.

Don't be afraid to add broken parts ! The house is supposed to still be standing, so don't go too far. You can see that I broke a wooden beam, a pipe, a board, another part of the roof, and a window. When you break something, use the clone stamp tool to fill in the empty space you created.

Make it look dirty. First of all, the windows. I used a non regular brush and painted the windows with a matte color. Then, change the transfer mode of the dirt layer to make sure that dirt and windows blend nicely together. For this example I chose the Luminosity mode.

Repeat that step, only do it on the entire house. Paint with a dirtier color and set your layer to Multiply. Make sure you make joints and edges look filthy too, because that's where dirt appears most. This is one of the longest steps, but take your time and don't mindlessly add dirt everywhere !

Here, the porch, zoomed in.

The last step is to create a Levels adjustment layer to get the final contrast of the matte painting.

Matte Painting in Photoshop Part 2: Snow

This is my second matte painting tutorial. Here I wanted to change the season of a scene from summer to winter.

First of all, find a good reference picture. I chose to use a picture of a house I found on the web. You can find very nice pictures for free, just look around !

Alright, first let's modify the colors. Using Image > Adjust > Hue / Saturation, try to get softer colors with less contrast and saturation. Make it look cold !

Create a new layer

Now we can begin painting the snow. Use a rough brush to create irregular shapes. In the tools window, set the foreground color to pure white, and the background color to a blue-tinted white which will be used to add shadows on the snow. All steps involve working alternatively with these two colors.

Begin by adding snow on the edges of the house where the snow would naturally fall onto.

With the blueish white, paint the inferior part of the snow (the shadows). This will add depth and will simulate the way snow reacts to light.

Create a new layer

With the same brush and same white, paint the windows to give them a frosted look. Set this layer's transfer mode to Overlay to make it match.

Create a new layer

Same principle, on the roof this time.

Make sure you stay true to the original lighting. Parts where the sun directly hits the roof should be a lot brighter than the darker spots, which will be blueish. This is important especially on the cone shaped parts. When everything will be painted, you can then use the Blur tool and make a smooth transition between pure white and blueish white. After that, use the Burn and Dodge tools to increase or decrease contrasts. If you use Burn on the blue-tinted whites, it will give you an ice look, which can be interesting.

Create a new layer

Now we are going to paint the ground. I used an irregular brush so that the grass wasn't entirely covered. Then using the blueish color I added nuances to simulate an undulating look. I also left a clean way that goes to the door. Same principle to add snow applies to the trees and bushes in the garden.

Now let's do something to avoid boredom from only adding snow! Using the Dodge tool, on the house layer, brighten spots here and there to add frosted parts, as well as to lighten up the dark parts of the house (like the inside of the porch). Do not forget that snow is a reflective surface, it will bounce light off pretty much everywhere.

Using the same method, brighten up the rest of the scene like the trees and sky. Subtle, but necessary since it adds the important detail that sells the overall effect and makes the image look natural.

Create a new layer

Now on to the extremely boring step : powder snow over the trees. Powder is subtle, so don't overdo it! Still using the same method, add snow accumulations on branches, the most difficult part being to actually see where those branches are. It depends on the quality of your picture. If you have chosen a picture without trees you are a cheater !!

For the big branches in the foreground, we can see leaves. I chose to add snow on groups of leaves, which can be time consuming, but you should not choose the shortest way over quality work.

Create a new adjustment layer:

Brightness/Contrast

This step is optional, but I created a layer and have applied a linear gradient from top to bottom to increase the contrast at the bottom of the pic.

Matte Painting in Photoshop

Part 3: Castle

Here is the making of my third matte painting, this time it is the Oratoire Saint-Joseph (in Montreal) under the rain! I use a Wacom Intuos² A4 board. For each step of the matte painting, useless to remind you to create a new layer so that the work will be easier and mistakes avoided!

First of all choose a photograph of good resolution. I found the photograph of "l'Oratoire St-Joseph" (in Montréal).

Here is a perfect sky, found on the Net, which will go very well for what I want to make.

First of all, start by isolating the castle by putting it in a layer and by erasing the original sky. Here I used the tool polygonal lasso for the building, and a soft gum for the foliagees.

Now one will erase all that should not be there a few centuries ago, i.e. the cars, the tourists, the standard lamps and the barriers. For that, use the tool Clone Stamp. It is not very complicated, nor very long with this example.

I want that this scene occurs in stormy weather, therefore it is necessary to erase the shadows created by the sun.

Always with the Clone Stamp erase the shadows on the ground of the shrubs and the trees. With the Dodge tool erase a little the contrasts of the elements by clearing up the zones of shadows in order to create an ambient light.

Now one can add the Cloud layer behind that of the castle.

One will accentuate the contrast of the sky while insisting on the clear zones as if a storm lit the clouds by the top. For that duplicate the Cloud layer and pass the copy in mode Color Dodge.

Now it is necessary to harmonize the colors of the two elements: sky and castle. Modify the color of the castle with menu Image > Adjustment > Color Balance, and make your best so that the tone of colors correspond.

Then select the Castle layer, and in menu Layer > New Adjustment Layer choose Color Balance. Thanks to this adjustment layer which is created on top of the others, one will be able to change the general color. Give a distressing atmosphere to the scene.

Profit finally to obscure the areas on left of the building with the Burn tool, because they are not exposed to the light of the clouds of right-hand side... hum does it make any sens LOL? It is a rather subtle effect, but that brings a small significant detail.

Here is a zoom to understand better.

Now one will add a little grain to the Castle layer by adding noise.

Before

After

One now will add a small detail, that can be anything, I chose an old carriage found on google. Place this layer below the adjustment layer, thus its color will be automatically adjusted with that of the scene. If there are still differences correct that by going in Color Balance.

Still a thing with the carriage, it is necessary to give it a shadow. So select the Castle layer and with the Burn tool slightly obscure the ground below the carriage. Subtle effect but important one.

Here is the result ! Not that bad, but now I want to add rain. Obviously for a matte painting made for a movie the rain would be created in compositing and animated. But here it is simply to make a still image, so we don't care if the rain remains frozen !

Let's work on the rain. Create a new layer and fill it with black with the Paint Bucket tool. In menu Filter > Noise apply Add Noise, choose Gaussian and Monochromatic, 10 or 15 should suffice for Amount. Go in Image > Adjustments > Levels and tweak it to erase some noise and to make it more visible. Finally in Filter > Blur apply a Blur Motion, which simulates a basic rain.

Change the Rain layer mode to Screen mode in order to blend it in the scene. Play with the opacity of the layer to adjust it with your scene.

Repeat the creation of a second Rain layer but with a little more noise to get a denser rain. Lower the opacity of this second Rain layer to simulate the rain in the background.

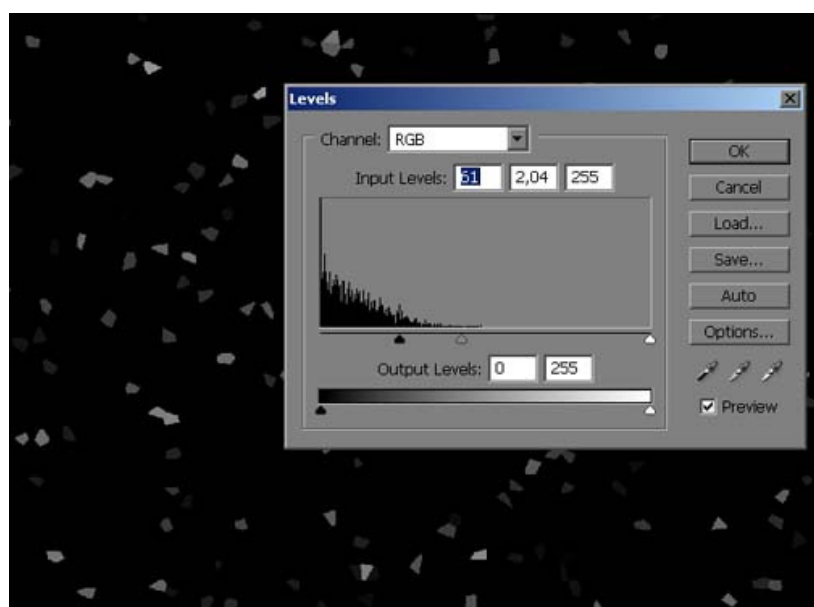

Now one will create large water drops on the image as if the scene was seen from behind a window. Create a new Drops layer filled with black, add noise.

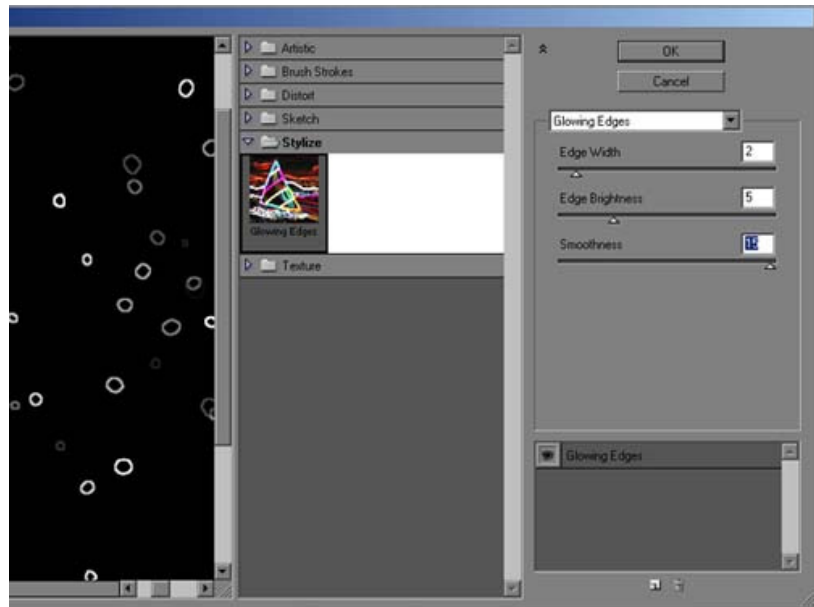

In menu Filter > Pixelate choose Crystallize in order to obtain large crystals of noise instead of the small points.

Adjust the number of crystals in menu Levels.

Then apply the Filter effect > Stylize > Glowing Edges, which will create circles around each crystal. It looks more like water drops now.

Here the result which I obtained with this method.

Now change the layer mode to Color Dodge, which will make the drops less visible in dark areas of the scene.

We leave for the moment the drops like that, we'll return there at the end.

Here we'll create reflexions on the wet ground. Start by duplicating the Castle layer and Clouds layer and merge them together. Now in Edit > Transform choose Vertical Flip to reverse the Reflexions layer. Move it so that the bottom of the stairs is the line of symmetry. Finally you can cut out this layer so that it is only visible on the principal alley of the castle.

Change this layer mode to Darken and opacity to 30%.

Here is the very light reflexion but which brings a small key of realism.

Finally I added the filter Filter> Distort > Glass in order to scramble the reflexion a little. It is not really essential, but if one wants to look more closely at the image we'll see that water disturbs the reflexion.

Now do the same with the carriage !

We return to our water drops! For this final effect it is necessary to flatten all the layers of the scene, so make a copy of your file and choose Layer > Flatten Image. The image is now made of one single layer, we will be able to apply effects to the whole image now. In menu Filter choose Liquify. Click on the Bloat tool in the toolbar on the left of the Liquify window. Setup your brush radius and its density and paint on each drop in order to simulate an effect of diffraction. It is not very easy at the beginning so do not hesitate to start again as many time as you want.

Once that you made all the drops you can also create water trails behind the drops which run along the window. I used a mix of several tools of the Liquify module like Forward Warp or Turbulence. Leave Liquify. Finally we will accentuate the light and dark areas of the drops by painting with the tools Dodge and Burn. This water drops effect is obviously not essential, but in fact I especially wanted to test it.

So here's the final result:

Modern Ruins

By [Tocath](#)

How to turn a modern day city into decaying ruins.

Part 1 : Overview

This tutorial will show you the steps and tricks I used in turning Hong Kong harbor into a wasted reflection of itself.

Basically, we're going to turn this:

Into this:

Let's begin!

Part 2: Planning

Any photoshopped image must start with a great source. Ruins are no exception. For my H2H with Norrit, we were limited to Non-American, Non-European cities. I chose Hong Kong. Ideally, you want a city with a recognizable landmark or building. This can get tricky, as your contest may have 18 New York entries and 20 from Paris. So, be aware that whatever city you choose may be duplicated. Impirnt your own style on whatever city you choose.

After selecting a city, find a picture that displays a good view of the features you want to destroy. I would suggest using only images greater than 1024x768 in size. Using a tiny source image for this contest will make things very difficult when it comes time to put in detail.

Here is our source image, a small crop for tutorial purposes:

Let's talk for a moment about the source pictures for our destruction. I can almost guarantee you that typing "ruins" into Google will get you nothing better than the Parthenon or the Pyramids. While these are certainly ruins, they don't offer much help to those of us who have to ruin modern buildings. Modern materials require modern ruins. So, here is a quick list of words that will bring us modern destruction:

- bombed
- bombed out
- destroyed
- gutted
- rubble

It also helps to know your geopolitics. These words brought me the most useful images:

- Belgrade
- Grozny
- Kosovo
- Lebanon
- Sarejevo
- WTC

I used 24 different images of rubble and destruction in my Hong Kong image. You don't need nearly that many, but you'll be happier with a greater variety to work from.

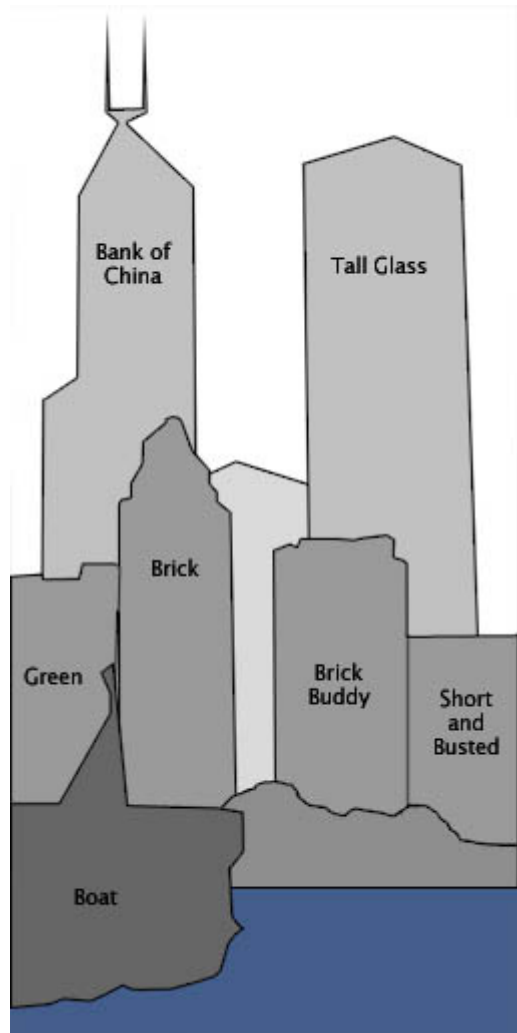

We're almost ready to start butchering our buildings. First though, I find it helpful to have some organization. My final Photoshop file was over 50 layers deep, and I would have been lost had I not given the buildings names, like this:

You can see that I only know the real name for one building. It doesn't matter, just as long as you can remember it.

Part 3: Preparation

Let's start destroying!

The first thing is to identify areas where you will be taking large chunks out of the building:

Create a new layer. Set the Clone tool to "Use all Layers" and clone the sky and ground to create what we would see if a piece of the building wasn't there. Notice that the sky behind the Bank of China building isn't perfect. For this building, I was aware that I would be putting some rubble over that, so I didn't spend a ton of time getting it just right. You only need a nice backdrop to work from.

Part 4: Bash

Creating the destruction and rubble is perhaps the most time consuming bit of work.

The first thing I'll show you is creating false structure. This is not always necessary, but it can add a sense of realism. Let's create some struts for the Bank of China building. I came across a picture on the net of this building under construction, so I have a good idea of what the insides looked like.

Grab a rubble pick to make our struts. This'll do:

Then, cloning from the rubble, create strips. These are the floors of the building. Copy these until you have a good amount, then rotate and place over the Bank like so:

Pay close attention to the angles when creating false structure. You want it to match as closely as possible to the angle of the building.

Next, eliminate a portion of the struts. This is where you get to be creative. Try to think as you are doing it what consequences your actions have. If you erase a floor here, the mass from the floor must have fallen somewhere, right? Maybe it took out a floor below. Maybe it just landed on the floor below, depositing rubble. Be creative, but don't be completely random. It's an interesting balancing act between chaos and structure.

Part 5: Bash continued

Now that you've created any false structure necessary, lets get to the real chaos.

Open your rubble images, say, these three:

Now this next part will be much easier if you have a tablet. A tablet's best feature is the ability to sense pressure. If you have a tablet, set your clone brush to "Shape Dynamics" with the Size jitter controlled by the pen pressure. This will let you make very thin, light strokes. If you don't have a tablet, that's ok. Simply control the size of your brush by tapping quickly on the bracket keys. [= decrease brush size,] = increase brush size.

Ok, create a new layer and clone some chaos from your rubble pile, like this:

Use varying widths of stroke to create areas of light and darkness. Pay close attention to your shadows. You need to be aware of where the light in your scene is coming from, and where it will cast the shadows. In my scene, as in most, the light comes from above. Notice that in areas where surviving structure overhangs destroyed buildings, I have added shadows. I prefer to use cloned shadow area instead of simply painting black or using the burn tool. Using cloned shadow from a rubble pile will give you a more realistic effect.

Continue cloning until you have something like this:

Create new layers for each building, or set of buildings. This will help you control what you see, and will avoid destroying detail you have worked hard on.

Try to pick a different source rubble pic for each building. Even before you start cloning, it can be helpful to adjust the hue and saturation on the rubble pic to more closely match the building you're destroying.

Note also that I took some liberties with the actual look of the brick building as well as the short and busted. If you need to make adjustments to allow for more destruction, do so. This is your image. Who knows what kind of upgrades the buildings have had!

Part 6: Trash

Now that we have destroyed some facades and collapsed floors, lets add an element of age. The first thing to remember is that destruction is dirty. Clouds of dust in the air, acid rain and soot can make a place look absolutely filthy. Let's throw some on!

I like to apply dirt and grime on a new layer, set to 'multiply' or 'darken' blend mode. Eyedrop a shadow color from your building. It's best to use this method instead of straight black, since the eyedrop will pick up on any hue present. Create a new layer and paint thin strips of color on and around ledges. Next, use the smudge tool to grab that color and smear it down, simulating the effect of rain carrying particles downward. You should come up with something like this:

After you've done that, I like to apply some nice color to get a rust and soot effect. For my Hong Kong pic, I used a sheet of paper with coffee and tea stains. A texture like this will have lots of great detail that will further grime up the image. Select a few buildings and paste it over like this:

Selectively erase in areas and get rid of anything that is jarring. Then, set the new texture layer to 'color burn', and drag the opacity down just a bit until it looks good, like so:

Part 7: Trash continued

Next, we want to simulate some oxidization and salt deposits from rain and sea. Grab a new texture pic. For mine, I used an image of white paint cracking on a wooden fence. Again, create a new layer and paste in the texture, like so:

Erase any detail you don't want and set the layer's blend mode to 'soft light'. Decrease the opacity until you're happy with it. This should leave your building looking like this:

Next, we're going to work on the water. First off, realize that any boats in the water may be sunk, or sitting lower. Raise the water level so that the boat appears to be taking on water. Additionally, remove any white water that exists. Your boat is not moving, and should not be creating a wake. Next, select a brownish color and paint some detail onto the water itself. Set the layer to darken mode to achieve this:

Next, you're going to want to add some rust and age to the boat. Grab a new texture map. I used the paper with the coffee stains. Paste that over the boat and erase any unwanted detail. Set the layer at 'color burn' and decrease the opacity to arrive at this:

Part 8: Finishing up

You're almost done. We've got a good image, but we want to bring it all together with some post-effects.

Use ctrl+shift+c to copy the entire image merged, or go to 'Edit >> Copy Merged'. Paste this at the top of your layers list.

The first thing we want to adjust is saturation. Crank down the saturation about 25% to simulate a somewhat overcast day:

Next, we want to make the image a bit more contrasty. I prefer to use 'Image >> Adjustments >> Selective color'. Using 'Brightness and Contrast' can affect saturation, and we don't want that. Selectively darken the blacks first, adding 5%. Next, edit the Neutrals, taking out 10% black. Additionally, for my image, I corrected a slight blue cast by taking out 3% cyan and adding 3% yellow. You should arrive at something like this:

Finally, to give the entire image a sense of cohesiveness, and further add to the grimy feel, use 'Filters >> Sharpen' and 'Filters >> Noise' to sharpen the image and add a little noise. Don't go overboard, use sparingly to add some dirt. Do a final once over, selectively desaturating anything that pops too much.

You've now got a finished product:

Matte Painting: Mystic Night Scene

We will be creating an mystic night scene with rainy atmosphere. Few preparations are required before you start. First basic step is a concept and where will be the matte paint used? Always start with rough thumbnails. Bring down your thoughts on paper. Scan it if needed. Try to colour them roughly with simple patches of colours considering the atmosphere you want. Once you are happy with the result its time to finalize!

Before we start our final work we need to collect references and high resolution images. References and image library is very important. Dont just look for sources on the net but also from books, photographs or click some good snaps yourself.

This the final matte. Before I start I normally divide my page, if the matte has to be fully generated on the computer. Normally horizon line should be off center so that it dose not divide the picture into 2 parts.

Step 1

I start colouring the water first with an airbrush with an textured brush so that it gives me no sharp edges. everything should be smooth. Opacity of the brush is 50%. This gives me overall idea of the placements.

Step 2

Now in a new layer above the water layer I start adding details. some mountains foreground mountains dark and background ones light. some debris floating on the water or some small plants.

Step 3

Now here I start adding details on the right side of the scene. I have merged hand painted mountains with some photographs.

Step 4

I continue adding details with some more photographs of rock and painting over for the desired effect. Finally we get the basic layer of the matte. now we need some depth and more details! It's time for some rainy clouds.

Step 5

Ok, now you must be wondering how did I get this? yes, its again merging of photographs and hand painted clouds equally. Eraser, air brush and rubberstamp are the main tools I used here.

Step 6

Ok, now I place the cloud layer over sea layer. Slightly overlapped at the edge of horizon so we get smooth blending! :) I know you still see the unfinished edges but don't worry we will fix it ahead.

Step 7

To create some more interest, I added an tower like mountain. and painted it dark blue. Also, some extension of the picture is done with help of some snaps and I hand painted over the rocks a bit.

Step 8

The final desired effect I need was something blue and mono colour feel with different tonal value. so firstly I converted the step 7 picture to black and white gradient map and then I played around with colour balance and variation tool. Finally we are done to composite this shot.

Tips: A. Keep all the pictures or references or ur painted layers in different sets in the layer tool-box. name the sets clouds, ground, mountains etc. so its easy to navigate when it comes to the point of some changes in the picture. B. If you plan to animate it in after effects, with some subtle cloud movements, then be carefully you dont merge the layers into one.

The Haunted House

Daniele Montella, 7 December 2004

The Haunted House was developed during Halloween, when I wanted to express the idea of an eerie-looking house. Matte painting has always fascinated me, and with the help of digital tools today, it is possible to enrich environments more easily than ever before.

Study of the Image

The general process employed for this image is to use photographic elements, combine them and enhance them in original ways. My intention was to express anxiety, isolation and the frustration felt during a horror movie. There's a cliché in these movies where a group of friends stand in front of a haunted mansion in awe. The main details of the haunted house required: dry and twisted trees, a cloudy dark sky that created the most horrible feeling of isolation and different types of gravestones. I used these photographic elements with the intention to modify and enhance them later on.

Composition

To compose my collage of images, I use the 'Rule of Thirds' which is a photographic composition dividing the space into 9 identical pieces on a grid (thirds). I insert the house on the right third and a twisted tree on the left third. In terms of depth, the image is divided into four planes of depth. The closest is on the twisted tree to the left, then the gravestones, the tree on the right, and the house almost in the background. This way, your eye is moved around the image in an anti-clockwise direction for a dizzying effect.

Tone and Colour

The house is neglected by humans and infested by ghosts. To portray this, I opted for a green-yellow tone, which is associated with illness. It is the colour of decomposing human skin, urine, mucus and many other repulsive things.

Using the Brightness/Contrast settings in Corel PhotoPaint, and tweaking the tone curve, I was able to totally change the original photograph (which was in broad daylight) to a washed-out house that looked like it was photographed on an overcast, rainy day. I recovered a bit of colour by using the Hue/Saturation settings to make the house a slight green-yellow colour.

Painting

Once the total view of the composition was in place, I begin painting the missing details and adjusting the existing ones. This is the most complex and time-consuming part of the project. Starting with the house, I repainted entire portions of it such as replacing the stairs, removing the lush green foliage and replacing it with dead or dying shrubs.

Then I began to "ruin" the house and give it a sense of weathering over time by staining it. First with a light black brush using the Colour Burn filter and then digging holes in the walls and roof where I painted rotten and destroyed wooden boards. I also extended parts of the veranda and roof by hand-painting them in.

I managed to find images of dirty trees that I cloned to create the background forest behind the house. This, however, didn't work that well to begin with because it looked totally flat. With a grey colour and a thin brush, I painted branches and trunks in with differing tones of grey to give a sense of depth to the forest. I also did the same with the plants, bushes and shrubs surrounding the house.

Returning to the two main trees in the foreground, I used the Clone tool to paint in more branches using the texture from the original image.

For the gravestones, I employed similar techniques used on the house to give them a weathered look, and also painted in two new ones. For additional effect, I painted the shadows of the tree branches on the ground and gravestones.

Effects

This is where I begin enhancing the basic image. Using the Effect Tool/Custom Sharpen feature in Photo Paint, I begin to sharpen portions that I have just painted in, such as the broken wooden boards, the branches, bushes and twigs.

To make the image more interesting, I made one of the windows in the house light up by hand painting the effect with a light yellow. To create the glow of the light, I used a soft circle brush to paint the area on a new layer, with a much lighter yellow (almost white) with no transparency, but the layer mode set to "Add".

The sky is the result of many tests using green to grey colours and a big brush. Details such as the clouds were painted in using a thinner brush and setting some brushes to Colour Dodge and Colour Burn modes.

Final Image

The final image is a pseudo-photo-real haunted mansion, employing clever digital techniques and photographic elements!
